# COURSE OUTLINE AND TABLE OF CONTENTS

Acknowledgements ............................................................................................................ ix
Antitrust Guidelines for ICPI Meetings ............................................................................... x
ICPI Fact Sheet .................................................................................................................... xi
ICPI Contractor Tool Kit for Members .............................................................................. xii
Contractor Membership Benefits ....................................................................................... xiii
Why Buy ICPI? ................................................................................................................... xv

## SECTION 1: Introduction ............................................................................................... 1
A: The Course: Objectives, Prerequisites, and Benefits ..................................................... 3
B: Registration and Course Procedures .............................................................................. 5
C: Concrete Segmental Paving: A Brief History ................................................................. 7
D: Overview: Components of an Interlocking Concrete Pavement System/Comparison to Other Pavement Systems ............................................................................. 9

## SECTION 2: Safety ......................................................................................................... 13
A: Introduction – The Four-point System .......................................................................... 13
B: Implementing a Company Safety Program .................................................................... 15
C: Conducting a Hazard Analysis ...................................................................................... 17
D: Typical Hazards on a Hardscape Installation Project ................................................... 19
E: Personal Protection Equipment ..................................................................................... 21

## SECTION 3: Job Planning and Documentation .............................................................. 27
A. What’s in it for me? ........................................................................................................ 27
B. Job Jacket Contents ...................................................................................................... 27

## SECTION 4: Job Layout, Planning and Material Flow .................................................... 45
A: Job Layout For Excavation ........................................................................................... 45
B: Job Planning .................................................................................................................. 47
C: Flow of Materials ......................................................................................................... 49

## SECTION 5: Soil Characteristics and Compaction .......................................................... 53
A: Gradation Fundamentals, Sieve Analysis and Standards ................................................. 53
B: Soil Classification, Soil Properties and Quick Field Identification ................................ 55
C: Soil Compaction and Moisture-Density Relationships ................................................ 61
D: Measuring Soil Compaction ........................................................................................ 63
E: Soil Compaction Methods and Equipment .................................................................... 69
F: Geotextiles: Purpose and Uses ..................................................................................... 77
List of Figures

Figure 1-1: Example of a well-planned, highly functional paved walkway and pool deck ................................................................. 1

Figure 1-2: The Romans built the first interstate highway system with segmental pavement over 2,000 years ago .................................. 7

Figure 1-3: Components of interlocking concrete pavement .................. 9

Figure 1-4: There are three kinds of interlock: vertical, rotational, and horizontal. The unique aspect of concrete pavers is that they interlock to help spread loads. ............................................. 10

Figure 1-5: Load distribution of pavements ......................................... 11

Figure 2-1: Examples of safety equipment for paver installers .............. 21

- KneeSeat – A KneeSeat™ is an alternative to traditional knee pads, offering greater comfort and less stress on the knees when kneeling ................................................................. 21

- Finger Tape – Finger tape is used to protect fingers when using rough product or in wet conditions .............................................. 21

- Knee protection – Knee pads protect workers knees from moisture, cement, cold and sharp rocks .......................................... 21

- Dust masks – OSHA requires a minimum of 2 head bands and a bendable steel nose bridge .......................................................... 21

- Hearing Protection – Hearing protection is required around any noise producing activities such as sawing, compacting, or other machine operations ......................................................... 21

- Gloves – Hand protection will protect installers from abrasive injuries; shown are vinyl coated polyester gloves ........................... 21

- Safety Glasses – A good pair of safety glasses must protect the front and sides of the eyes. They should not be too dark of a tint and should be worn whenever impacting, striking, cutting or splitting anything .............................................. 22

Figure 2-2: Sample of a Job Hazard Analysis ............................................. 22

Figure 2-3: Sample of a job function analysis .......................................... 22

Figure 4-1: Job layout and staking .............................................................. 45

Figure 4-2: Flow of materials onto a job site ............................................. 49

Figure 4-3: Clamp picking up cube of pavers with no wood pallet ........ 50

Figure 4-4: Bundle buggy used to bring pavers to laying face .................. 50

Figure 5-1: Sieve analysis is a key to understanding the characteristics of soils, aggregate base, bedding and joint sands .................. 53

Figure 5-2: There are several ways to classify soil depending on its intended use. A common method for classifying soils under pavements is into three groups separated by particle size—sand, silt, or clay. This is illustrated as a triangle in the USDA Soil Classification System .............................................................. 55
List of Figures continued

Figure 5-3: Unified Soil Classification Related to Suitability ...............57
Figure 5-4: The relationship between moisture and density:
Too little moisture means that density decreases. Too much
moisture also means density decreases. All soil and base
materials have an optimum density—a balance between water
content and weight per unit volume. The graph illustrates
how density changes with moisture content.................................62
Figure 5-5: Comparison of the moisture-density relationship of
various soils .....................................................................................64
Figure 5-6: Differences between Standard and Modified Proctor
Density Tests ................................................................................65
Figure 5-7: Nuclear Density testing equipment ....................................67
Figure 5-8: Dynamic cone penetrometer used to test compacted soil
density. The sliding hammer is being raised into position by the
operator’s hands ........................................................................67
Figure 5-9: Reversible Plate Compactor .............................................69
Figure 5-10: Rammer (jumping jack) .....................................................69
Figure 5-11: Walk-behind Vibratory Roller ...........................................70
Figure 5-12: Riding Vibratory Roller ....................................................70
Figure 5-13: Compaction machine application based on soil type.......71
Figure 6-1: The role of fines in aggregate bases .................................80
Figure 7-1: Change in paver shape .....................................................88
Figure 7-2: Change in laying pattern direction ....................................88
Figure 7-3: Precast concrete/cut stone ................................................91
Figure 7-4: Partial depth precast concrete edge .................................91
Figure 7-5: Aluminum and steel edging .............................................91
Figure 7-6: Plastic edge restraint .....................................................91
Figure 7-7: Poured-in-place concrete curbs ........................................92
Figure 7-8: Troweled concrete and “submerged curb” edges ..............92
Figure 8-1: Screeding bedding sand on screed bars .........................98
Figure 8-2: Powered screed pulling bedding sand .............................99
Figure 9-1: Aspect Ratio = Length ÷ Thickness .................................103
Figure 9-2: Click and drop ...............................................................107
Figure 9-3: Starting Runner and Parquet patterns from corner ..........108
Figure 9-4: Starting Herringbone patterns from corner ....................108
Figure 9-5: Marking parallel lines and creating a pyramid-shaped
laying face ......................................................................................108
List of Figures continued

Figure 9-6: String lines may be used to check for squarness to the edges by using the 3-4-5 triangle. Once this right angle is established, string lines can be laid and pavers can be laid easily, especially when working from a corner. A right angle is laid out with a mason’s line, stakes, and a measuring tape.
Laying out a 3-4-5 triangle requires two people.................................109

Figure 9-7: Making a perpendicular line ...................................................110

Figure 9-8. Perpendicular, evenly spaced string lines mark the center of circles for layout................................................................................111

Figure 9-9: Squaring an uneven corner ....................................................113

Figure 9-10: Filling the corner.................................................................113

Figure 9-11: Paving around an opening or obstruction .........................114

Figure 9-12: Paver splitter .........................................................................115

Figure 9-13: Masonry saw ..........................................................................115

Figure 9-14: Dry saw increases speed and accuracy for paver cutting.
However, they should include integral vacuum dust collection systems to meet OSHA regulations...................................................117

Figure 9-15: Plate Compactor .................................................................119

Figure 9-16: Compaction sequence—working from the perimeter to the center of the pavement. All pavers should have two passes of the plate vibrator over them prior to filling the joints. After the joints are filled with sand, follow the same compaction sequence from the perimeter to the center ........................................120

Figure 10-1: Rutting in a vehicular pavement...........................................121

Figure 10-2: Settlement at a driveway entrance from inadequate compaction .....................................................................................121

Figure 10-3: Settlement at a curb due to bedding sand loss at the concrete curb joint. ...........................................................................121

Figure 10-4: Geotextile at the curb can eliminate bedding sand loss .121

Figure 10-5: Overlays over concrete or asphalt require geotextile below the bedding sand layer.................................................................122

Figure 10-6: ICPI recommends herringbone layout for vehicular applications such as streets and parking lots. For residential driveways, when using running bond patterns, install the pavement so that the bond lines are perpendicular to the direction of the traffic. ...........................................................................122

Figure 10-7: A herringbone pattern for a residential driveway application. Note the discontinuity in the bond lines. ......................122

Figure 10-8: Cleaning the surface of the pavement prior to sealing or stabilizing ..................................................................................124

Figure 10-9: Removing pavers with a paver extractor ..........................125

Figure 11-1: Utility cover .........................................................................127
List of Figures continued
Figure 11-2: Concrete beam ................................................................. 129
Figure 11-3: Crosswalk with concrete base ........................................ 129
Figure 11-4: Crosswalk in existing asphalt pavement ....................... 129
Figure 11-5: Marking a curve to be cut .............................................. 130
Figure 11-6: Cutting a curve with a dry saw ...................................... 131

List of Tables
Table 4-1: Grades and slopes ............................................................... 46
Table 5-1: Common Sieve Sizes ......................................................... 54
Table 5-2: Geotextile Requirements for Separation ......................... 77
Table 5-3: Geotextile Overlap Requirements ................................... 78
Table 6-1: ASTM D2940 - Standard Specification for
Graded Aggregate Material for Bases or Subbases for
Highways and Airports ................................................................. 79
Table 7-1: Application guide for edge restraints ............................... 88
Table 8-1: ASTM C33 – Gradation for Bedding Sand ..................... 93
Table 8-2: Canadian Standards Association (CSA) A23.1–
Gradation for Bedding Sand ....................................................... 93
Table 8-3: ASTM C144 – Gradation for Joint Sand ......................... 94
Table 8-4: Canadian Standards Association (CSA) A179 –
Gradation for Joint Sand ........................................................... 94
Table 9-1: Plan Ratio ...................................................................... 103
Table 9-2: Aspect Ratio ................................................................. 104

List of Forms
Tailgate/Toolbox Topics .................................................................. 23
Proposal/Quotation .......................................................................... 30
Patio Drawing .................................................................................. 31
Map of Site Location ...................................................................... 32
Foreman Worksheet-Pavers ............................................................. 33
Daily Time Sheet ............................................................................ 34-35
Job Quantity Sheet–Material ........................................................ 36
Job Quantity Sheet–Labor ............................................................... 37
Paver Job Information Sheets ......................................................... 38-39
Site Access Form ........................................................................... 40
Daily Time Sheet (Blank) ............................................................... 41
Job Quantity Sheet–Material (Blank) ........................................... 42
Job Quantity Sheet–Labor (Blank) ................................................ 43
